

## Experiment Number : 2

**1. Title:** Use var, let, const, and demonstrate basic features like template literals and destructuring; build a billing calculator with user input.

**2. Software/Tools Required:** Visual Studio Code (VS Code), web browser, HTML, JavaScript.

**3. Theory:** var also known as variable is function-scoped, let is block-scoped, and const is used for fixed values. The prompt() function accepts user input, and Number() converts input into numeric values. The program calculates the total amount, GST, and final bill using arithmetic operations. An object stores all billing details together, while object destructuring extracts required values easily. Template literals (``) are used to display formatted output with variable values using \${}. The document.write() method displays the billing receipt on the webpage.

## 4. Output:

**5. Result/Conclusion:** A billing calculator was successfully created using JavaScript. The program accepted user input, calculated the bill with GST, and demonstrated the use of `var`, `let`, `const`, template literals, and object destructuring effectively.
